

One thing *leads to another*

PRECISION COMPONENTS LEAD TO METER IMPROVEMENTS LEAD TO MORE GRAIN IN THE TANK

One thing leads to another, and any inaccurate part in your meter can lead to another skip or double and shrinking yields. Any one of these components will help. Together, they'll put up to an additional 2,000 ears per acre – 14 bushels – in your tank, without an increase in your population.

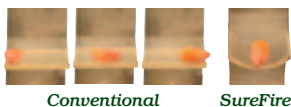

Built to the tightest tolerances, **Precision Fingers™** release a single seed – *any* seed – every time, for the best stands you've ever had. 93% of our customers agree.

Warped metal backing plates lead to skips. The poly **PopulationMax™** stays flat to singulate precisely. And its replaceable metal wear strips and inserts cost far less than a new plate.

The **adjustable brush** lets you fine-tune your meters on the fly every time you change seed types during the season to keep pinpoint accuracy in singulation.

SkipStop™ deadens the impact when seeds hit the housing, so they don't ricochet into the meter. Replace your back cover with SkipStop and watch the skips go away.

A seed released down the center of the tube can catch up with one bouncing around because it released off to the side. That leaves two seeds in one spot and none in the next – a virtual double and skip. Our new **SureFire™** cupped seed belt releases down the center every time for sure spacing and more ears.

Combine SureFire with our new **BullsEye™** seed tube for an unbeatable delivery system. Learn more at www.precisionplanting.com!

To *really* repower your planter – or optimize your new one – choose complete **Precision Meters™**, with all of these components, all designed and tested to work together for maximum precision and maximum yields.

The SureFire upgrade for every meter

What owners say about Precision Meters

- 95% are satisfied or very satisfied with their Precision Meters
- 91% would recommend Precision Meters to others
- 93% report that Precision Meters improved their singulation
