

# Good?

# Better.

Side by side  
from grower field  
Jasper County, Iowa  
August 2006

# You Bet.

It's easy to see the winner here. Pictured are representative roots from side-by-side strips in a grower's field in Jasper County, Iowa, in August 2006. Roots on the left are from a competitor hybrid with the YieldGard® Rootworm trait, damaged by rootworm pruning. At right are roots from Pioneer® hybrid 33B53 which contains the Herculex® RW rootworm protection trait.

All across the Corn Belt in 2006, trials are showing rootworm protection in Pioneer brand hybrids with Herculex RW and Herculex XTRA in-plant rootworm protection was superior or equivalent to that of competitor hybrids containing YieldGard Rootworm and YieldGard Plus. See inside back cover for 2006 wide-area results from Pioneer Agronomy Sciences testing.
